

raw block	A_0	B_1	A_1	B_2	A_2	...
width	r	s	s	s	s	
source index	0	1	2	3	4	...
path radius	1	2	3	4	5	...

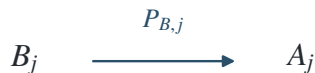

$r=3s/5$; blocks shown to scale in width

Recover B_j at radius $2j$

raw key: $A_{<j-1}, B_{\leq j-1}$

Recover A_j at radius $2j+1$

raw key: $A_{\leq j-1}, B_{<j}$

Each key also fixes the family, label, and source index.

Arguments use known corrected $\bar{u}$; gates and offsets read earlier raw u .

Two distinct incident coefficients give two known evaluations:

$$v + K_\nu u = R_\nu + C_\nu^v + K_\nu C_\nu^u \implies \text{recover } u, \text{ then } v.$$
